ChainScore

On-chain credit scoring for the DeFi era

ANDRÉ PINHEIRO PAES
Founder & CTO

The DeFi lending market is leaving billions on the table.

Every loan in DeFi is overcollateralized at 150% or more — not because users prefer it, but because lenders cannot assess credit risk. **ChainScore changes that.**

The Market in Numbers

USD 50B+	150%	40–60	USD 200M+
TVL in DeFi lending	avg. collateral required	fintechs need this	TAM by 2028

The Opportunity

→ **An untapped USD 50B+ market.** DeFi lending has scaled massively, but credit assessment has not evolved since 2018.
→ **40–60 fintechs globally** are actively trying to launch undercollateralized lending products and need credit scoring infrastructure they cannot build alone.
→ **No incumbent owns this market.** Existing on-chain scoring projects offer one-shot scores; none provide continuous monitoring or verifiable on-chain anchoring.
→ **First-mover advantage.** A 12-month head start on continuous monitoring creates compounding data network effects.

The Solution

→ **Score any Ethereum wallet in seconds.** ChainScore reads a wallet's full transaction history, applies a multi-agent ML pipeline, and returns a score from 0 to 1000.
→ **Continuous monitoring.** Autonomous agents watch wallets and emit alerts the moment risk profiles change — before defaults happen.
→ **Verifiable anchoring.** Every score is hashed to Ethereum, allowing any party to audit the underlying data.
→ **B2B REST API.** Delivered as SaaS to fintechs and digital banks — one endpoint, instant integration.

Business Model

Revenue	SaaS tiers + pay-per-query
Pricing	USD 500–25,000 / month
Margins	70%+ at scale
TAM	USD 200M+ by 2028

Traction & Ask

→ **Status:** MVP under development.
→ **Pilot:** LOI from Brazilian fintech (Q3 2026).
→ **Ask:** Pre-seed USD 250K, 12 months.

ChainScore for Lenders

Lend smarter. Risk less. Grow faster.

Try the API

Free tier available

If you lend to crypto users, you have one job: separate the trustworthy from the rest.

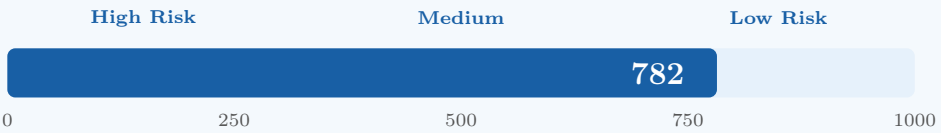
ChainScore gives you that signal. One API call, one credit score, one continuously updated risk profile.

How It Works

1. Send wallet address → **2. Analyze** agents inspect tx → **3. Score** 0–1000 + factors → **4. Monitor** webhook alerts

Average response time: under 800 ms

What a ChainScore Looks Like



Top factors driving this score:

→ **High protocol diversity** — active across 7 different DeFi protocols
→ **No liquidations in 24 months** — consistent collateral management
→ **Stable collateral ratio** — maintained above 180% throughout volatile periods

What You Get

→ **Lower default rates.** Reject high-risk borrowers before origination.
→ **Higher loan volumes.** Approve creditworthy users currently rejected by overcollateralization.
→ **Real-time risk.** Detect deterioration before liquidation triggers.
→ **Auditable decisions.** Every score is anchored on Ethereum — regulators and customers can verify.

Simple Pricing

Free	100 queries / month, public wallets only	USD 0
Starter	10K queries / month, all wallets, email support	USD 500
Growth	100K queries / month, monitoring alerts, SLA 99.5%	USD 2,000
Enterprise	Unlimited, custom models, dedicated support	USD 25,000+
